

# A - Overview and Objective

## Objective:

The objective of this analysis is to develop a convolutional neural network capable of classifying images with cracked concrete from images with no surface defects. Through transfer learning, MobileNetV2 and Inception V3 CNNs will be utilized for classifying the concrete images and have their performance compared to the developed CNN. The models' classification decisions will be explained using class activation maps.

## Dataset overview:

The dataset contains concrete images having cracks. The data is collected from various METU Campus Buildings. The dataset is divided into two as negative and positive crack images for image classification. Each class has 20000 images with a total of 40000 images with 227 x 227 pixels with RGB channels. The dataset is generated from 458 high-resolution images (4032x3024 pixel) with the method proposed by Zhang et al (2016). High-resolution images have variance in terms of surface finish and illumination conditions. No data augmentation in terms of random rotation or flipping is applied.

## 2.1 Open Image of Each Class

Opening a JPEG File and getting an idea of shape

```
In [10]: img = Image.open('Positive/19425.jpg') #open image

numpydata = asarray(img) #put image into an array

# <class 'numpy.ndarray'>
print(type(numpydata))

# shape
print(numpydata.shape)

<class 'numpy.ndarray'>
(227, 227, 3)
```

```
In [11]: pil_im = Image.open('Positive/19425.jpg')
display(pil_im)
```

Example of image classified as 'Positive' with crack.

```
In [12]: pil_im = Image.open('Negative/00001.jpg')
display(pil_im)
```

Example image with no crack, classified as 'Negative'

## D - Modeling

## 1.0 Baseline CNN Model

The Baseline CNN model was loosely based the popular VGG (Visual Geometry Group) model architecture. VGG is a very deep network (VGG16 consists of 16 convoluional layers) and uses 3x3 kernal sizes. All VGG hidden layers use an RELU activation function. This model consists of 4 convolutional layers, 2 maxpooling layers, 1 flattening layer, and 2 dense layers. The filter size also doubles through each convolutional layer stack, which is a key principle of VGG architecture.

WARNING:tensorflow:5 out of the last 9 calls to <function Model.make\_predict\_function.<locals>.predict\_function at 0x7feb3a5574c0> triggered tf.function retracing. Tracing is expensive and the excessive number of tracings could be due to (1) creating @tf.function repeatedly in a loop, (2) passing tensors with different shapes, (3) passing Python objects instead of tensors. For (1), please define your @tf.function outside of the loop. For (2), @tf.function has reduce\_retracing=True option that can avoid unnecessary retracing. Observing the model results, all models perform extremely well at classifying the two classes of image. It was possible to create a baseline model that performs comparably to established classification architectures
